

WIRELESS 2

Wireless Comes of Age

- Guglielmo Marconi invented the wireless telegraph in 1896
 - Communication by encoding alphanumeric characters in analog signal
 - Sent telegraphic signals across the Atlantic Ocean
- Communications satellites launched in 1960s
- Advances in wireless technology
 - Radio, television, mobile telephone, mobile data, communication satellites
- More recently
 - Wireless networking, cellular technology, mobile apps, Internet of Things

Cellular telephone

- Started as a replacement to the wired telephone
- Early generations offered voice and limited data
- Current third and fourth generation systems
 - Voice
 - Texting
 - Social networking
 - Mobile apps
 - Mobile Web
 - Mobile commerce
 - Video streaming

MOTOROLA FLIP PHONE - circa 1989 \$ 1100.00

WiFi uses radio waves to provide high-speed internet access to mobile devices and allows wireless communication between the connected devices.

Cellular uses cell phone towers to enable mobile device communication and provide internet access but requires a data plan attached to the device.

Wireless Impact

- Profound
- Shrinks the world
- Always on
- Always connected
- Changes the way people communicate
 - Social networking
- Converged global wireless network

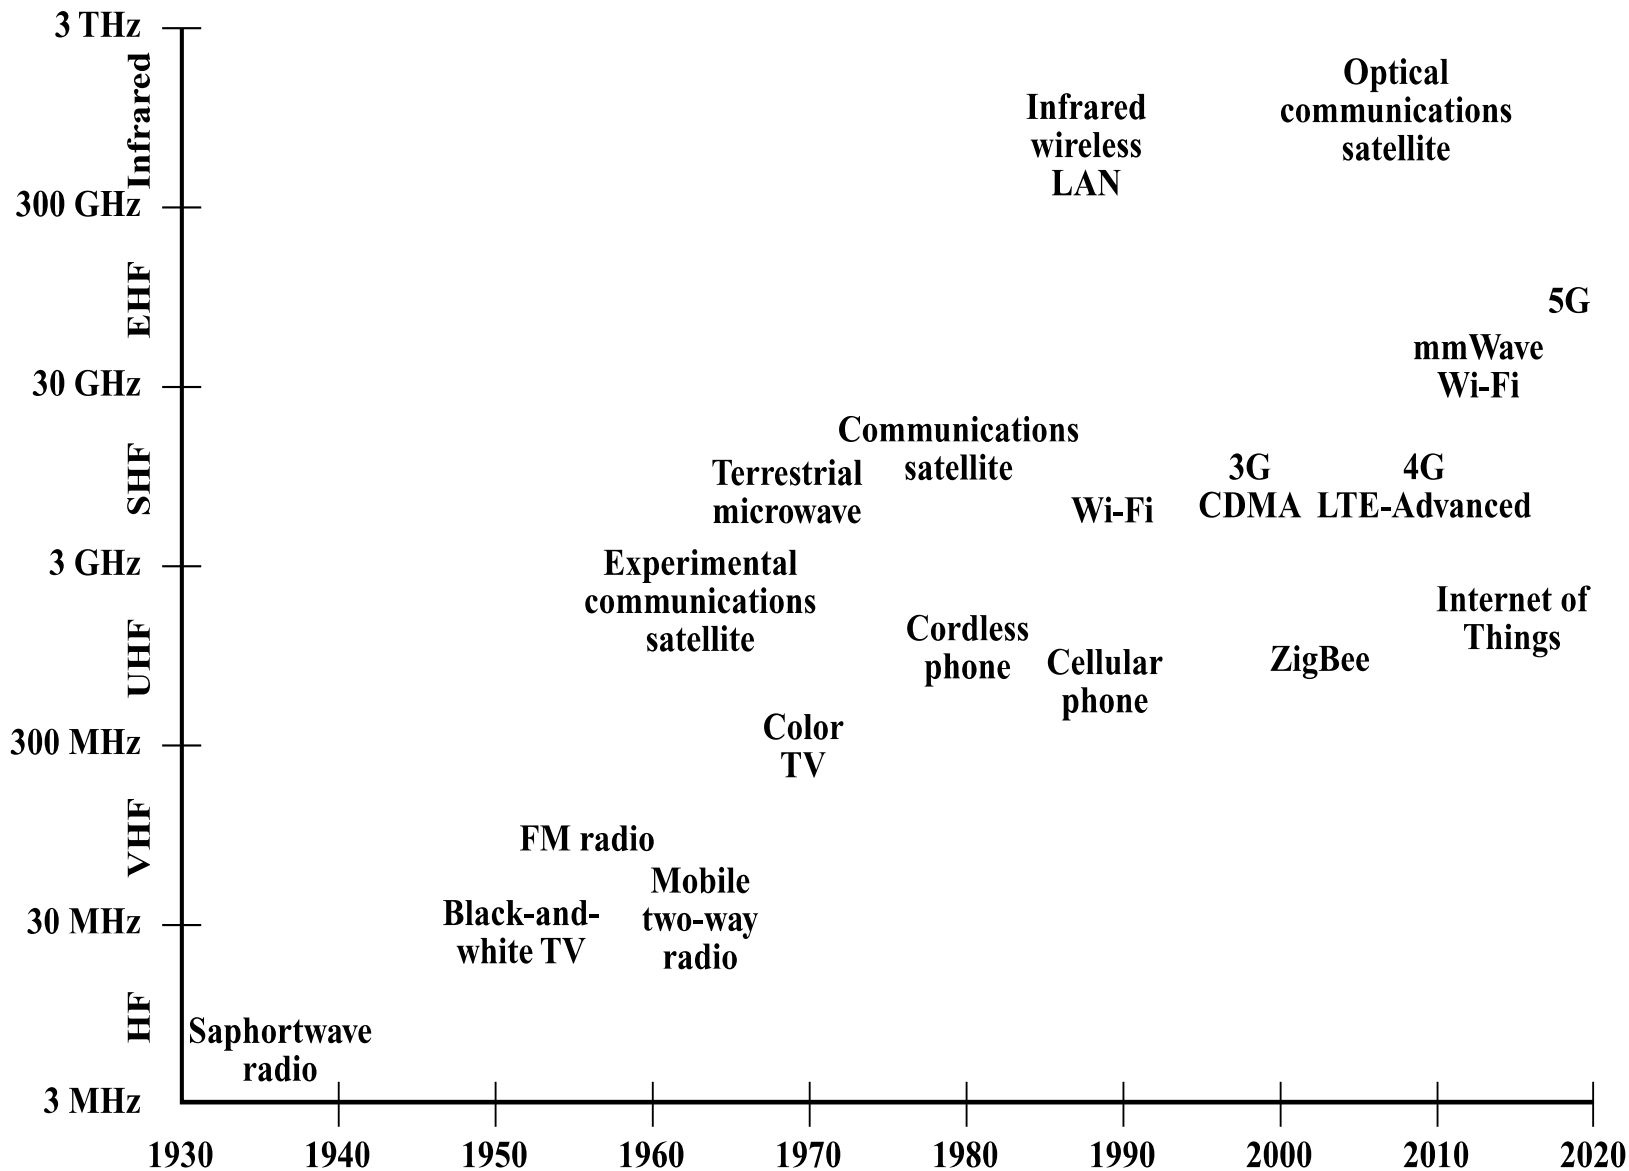

Figure 1.1 Some Milestones in Wireless Communications

Global cellular network

- Growth
 - 11 million users in 1990
 - Over 7 billion today
- Mobile devices
 - Convenient
 - Location aware
 - Only economical form of communications in some places

Global cellular network

- Generations
 - 1G – Analog
 - 2G – Digital voice
 - Voice services with some moderate rate data services
 - 3G – Packet networks
 - Universal Mobile Phone Service (UMTS)
 - CDMA2000
 - 4G – New wireless approach (OFDM)
 - Higher spectral efficiency
 - 100 Mbps for high mobility users
 - 1 Gbps for low mobility access
 - Long Term Evolution (LTE) and LTE-Advanced

Get reliable 5G home internet service. \$50/month.

Mobile device revolution

- Originally just mobile phones
- Today's devices
 - Multi-megabit Internet access
 - Mobile apps
 - High megapixel digital cameras
 - Access to multiple types of wireless networks
 - Wi-Fi, Bluetooth, 3G, and 4G
 - Several on-board sensors
- Key to how many people interact with the world around them

Mobile device revolution

- Better use of spectrum
- Decreased costs
- Limited displays and input capabilities
- Tablets provide balance between smartphones and PCs
- Long distance
 - Cellular 3G and 4G
- Local areas
 - Wi-Fi
- Short distance
 - Bluetooth, ZigBee

Future trends

- LTE-Advanced and gigabit Wi-Fi now being deployed
- **Machine-to-machine communications**
 - The “Internet of Things”
 - Devices interact with each other
 - Healthcare, disaster recovery, energy savings, security and surveillance, environmental awareness, education, manufacturing, and many others
 - Information dissemination
 - Data mining and decision support
 - Automated adaptation and control
 - Home sensors collaborate with home appliances, HVAC systems, lighting systems, electric vehicle charging stations, and utility companies.
 - Eventually could interact in their own forms of social networking

Control your home with Apple Watch

Activities	Suggested speeds	Cable	DSL	Fiber	Fixed wireless	Satellite
Email, web surfing & online shopping on 1-2 devices	5-10 Mbps	X	✓	X	✓	✓
Email, web surfing & online shopping on 3+ devices	10-25 Mbps	✓	✓	X	✓	✓
Streaming video in standard definition	5-10 Mbps	X	✓	X	✓	✓
Streaming video in HD	10-30 Mbps	✓	✓	✓	✓	X
Online gaming, 1-2 devices	10-25+ Mbps	✓	✓	✓	✓	X
Online gaming, 3+ devices	25+ Mbps	✓	✓	✓	X	X
Working from home	40+ Mbps	✓	X	✓	X	X

DSL (Digital Subscriber Line)

A technology for high-speed network or Internet access over voice lines.

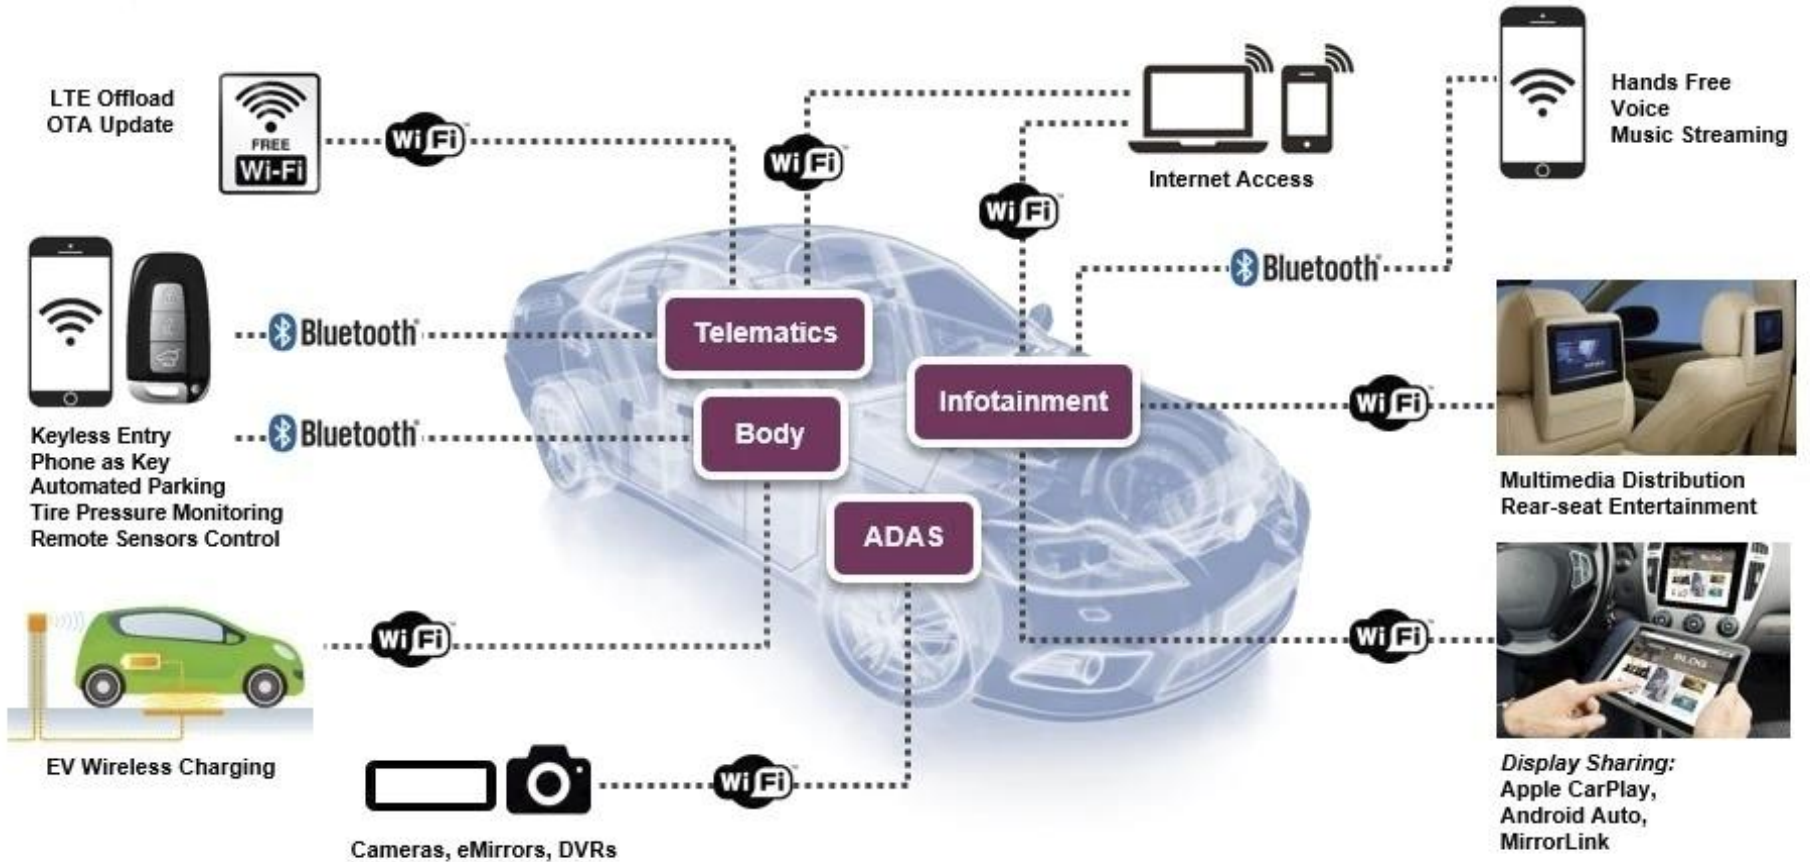

Today, let's take a look at the most common benefits associated with DSL internet packages like ours.

- No Tying Up Your Landline Phone.**
- Fast Downloads.**
- No Need for Extra Wiring.**
- More Secure.**
- Actively Supported.**
- Easy on the Wallet!**

Future trends

- Machine-to-machine communications
 - 100-fold increase in the number of devices
 - Type of communication would involve many short messages
 - Control applications will have real-time delay requirements
 - Much more stringent than for human interaction

Driving the Connected Car Revolution

Future trends

- Future networks
 - 1000-fold increase in data traffic by 2020
 - 5G – Not defined but envisioned by 2020
- Technologies
 - Network densification – many small cells
 - Device-centric architectures - focus on what a device needs
 - Massive multiple-input multiple-output (MIMO) – 10s or 100s of antennas
 - To focus antenna beams toward intended devices
 - Millimeter wave (mmWave) - frequencies in the 30 GHz to 300 GHz bands
 - Have much available bandwidth.
 - But require more transmit power and have higher attenuation due to obstructions
 - Native support for machine to machine communication
 - Sustained low data rates, massive number of devices, and very low delays.

The trouble with wireless

- Wireless is convenient and less expensive, but not perfect
- Limitations and political and technical difficulties inhibit wireless technologies
- Wireless channel
 - Line-of-sight is best but not required
 - Signals can still be received
 - Transmission through objects
 - Reflections off of objects
 - Scattering of signals
 - Diffraction around edges of objects

The trouble with wireless

- Wireless channel
 - **Reflections can cause multiple copies of the signal to arrive**
 - At different times and attenuations
 - Creates the problem of *multipath fading*
 - Signals add together to degrade the final signal
 - **Noise**
 - **Interference from other users**
 - Doppler spread caused by movement

Combating problems

- Modulation – use a signal format to send as many bits as possible
- Error control coding – add extra bits so errors are detected/corrected.
- Adaptive modulation and coding – dynamically adjust modulation and coding to current channel conditions.
- Equalization – counteract the multipath effects of the channel.
- Multiple-input multiple-output systems – use multiple antennas
 - Point signals strongly in certain directions
 - Send parallel streams of data.
- **Direct sequence spread spectrum – expand the signal bandwidth***
- Orthogonal frequency division multiplexing – break a signal into many lower rate bit streams
 - Each is less susceptible to multipath problems.

***Reliable and somewhat SPY Proof!**

Political difficulties

- Between companies
 - Need common standards so products interoperate
 - Some areas have well agreed-upon standards
 - Wi-Fi, LTE
 - Not true for Internet of Things technologies
- Spectrum regulations
 - Governments dictate how spectrum is used
 - Many different types of uses and users
 - Some frequencies have somewhat restrictive bandwidths and power levels
 - Others have much more bandwidth available

A Few slides from Beard & Stallings

CHAPTER 1

INTRODUCTION

These slides are made available to faculty in PowerPoint form. Slides can be freely added, modified, and deleted to suit student needs. They represent substantial work on the part of the authors; therefore, we request the following.

If these slides are used in a class setting or posted on an internal or external www site, please mention the source textbook and note our copyright of this material.
