

# SENSORS

**ROBOT = SENSORS + ACTUATORS +  
COMPUTERS**

# (SIMPLIFIED) CONTROL SCHEME OF MODERN MOBILE ROBOT

[https://www.oleg-shipitko.com/files/ugd/802739\\_54bf93fd34534080be9512b09bc545b5.pdf](https://www.oleg-shipitko.com/files/ugd/802739_54bf93fd34534080be9512b09bc545b5.pdf)

A **sensor** is a device that produces an output signal for the purpose of sensing of a physical phenomenon.

In the broadest definition, a sensor is a device, module, machine, or subsystem that detects events or changes in its environment and sends the information to other electronics, frequently a [computer processor](#). Sensors are always used with other electronics.

Devices which perform an "Input" function are commonly called **Sensors** because they "sense" a physical change in some characteristic that changes in response to some excitation, for example heat or force and convert that into an electrical signal. Devices which perform an "Output" function are generally called **Actuators** and are used to control some external device, for example movement or sound.

[https://www.electronics-tutorials.ws/io/io\\_1.html](https://www.electronics-tutorials.ws/io/io_1.html)

Electrical **Transducers** are used to convert energy of one kind into energy of another kind, so for example, a microphone (input device) converts sound waves into electrical signals for the amplifier to amplify (a process), and a loudspeaker (output device) converts these electrical signals back into sound waves.

The **National Bureau of Standards** (NBS) was founded by Congress on March 3, 1901 as an authoritative domestic **measurement and standards** laboratory, and was the first physical science research laboratory of the federal government. In 1988, the National Bureau of Standards was renamed the National Institute of Standards and Technology (NIST).

## Data Acquisition & Control Systems

Lockheed Electronics Company, Inc.

### Introduction

The temperature-current device (TCD) temperature sensor provides a breakthrough in low cost accurate temperature measurement. By taking advantage of the temperature sensitivity of a transistor's base-emitter voltage, a semi-conductor temperature transducer has been developed that provides a large and highly linear output. It eliminates the need for signal conditioning amplifiers, cold-junction compensators, and other costly accessories required by conventional temperature sensors (thermocouples, thermistors, and resistance-temperature devices). The output of the TCD temperature sensor is an industry standard 4 to 20 mA analog signal that may be sent directly to a central supervisory control and data acquisition (SCADA) computer or applied to a remote terminal unit (RTU) at the measurement location.

Figure 1

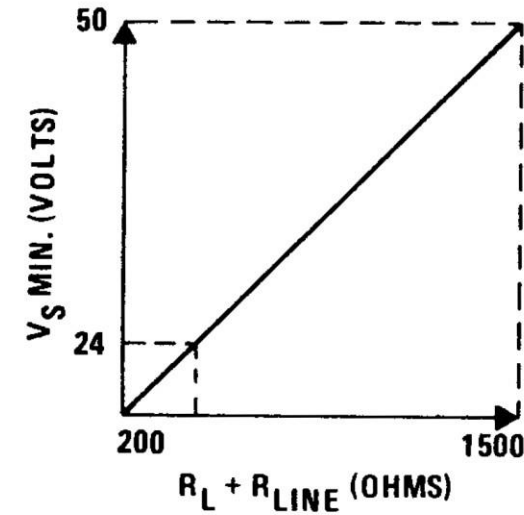

Figure 2

### Special Features

- Solid-state sensor and amplifier elements
- Two-wire output
- Practically unlimited lead length
- High accuracy and linearity
- Choice of three ranges:  
 -55 to + 45° C (-67 to + 113° F)  
 0 to + 100° C (32 to + 212° F)  
 -15 to + 125° C (5 to + 257° F)

### Specifications and Performance Characteristics

- Maximum Supply Voltage: 50 Vdc
- Minimum Supply Voltage: See Figure 2
- Operating Current Range: 3 to 22 mA
- Maximum Line and Load Resistance (See Figure 1): 1500 ohms
- Thermal Time Constant: Less than 10 sec
- Accuracy: 0.5% of span
- Repeatability: 0.2%
- Linearity: 0.5% of span
- Output: 4 - 20 mA in calibration range

# Classification of sensors

8

- **Proprioceptive** (“sense of self”, internal state).
    - Measures values internally to the system (robot), e.g. battery level, wheel position, joint angle, etc.
  - **Exteroceptive** (external state).
    - Observations of robot environment, objects in it.
- 
- **Active** (emits energy, e.g. radar) vs.
  - **Passive** (passively receives energy, e.g., camera).

# General sensor classification

9

General classification (typical use)	Sensor Sensor System	PC or EC	A or P
Tactile sensors (detection of physical contact or closeness; security switches)	Contact switches, bumpers	EC	P
	Optical barriers	EC	A
	Noncontact proximity sensors	EC	A
Wheel/motor sensors (wheel/motor speed and position)	Brush encoders	PC	P
	Potentiometers	PC	P
	Synchros, resolvers	PC	A
	Optical encoders	PC	A
	Magnetic encoders	PC	A
	Inductive encoders	PC	A
	Capacitive encoders	PC	A
Heading sensors (orientation of the robot in relation to a fixed reference frame)	Compass	EC	P
	Gyroscopes	PC	P
	Inclinometers	EC	A/P

A, active; P, passive; P/A, passive/active; PC, proprioceptive; EC, exteroceptive.

# General sensor classification 2

10

General classification (typical use)	Sensor Sensor System	PC or EC	A or P
Ground-based beacons (localization in a fixed reference frame)	GPS	EC	A
	Active optical or RF beacons	EC	A
	Active ultrasonic beacons	EC	A
	Reflective beacons	EC	A
Active ranging (reflectivity, time-of-flight, and geo- metric triangulation)	Reflectivity sensors	EC	A
	Ultrasonic sensor	EC	A
	Laser rangefinder	EC	A
	Optical triangulation (1D)	EC	A
	Structured light (2D)	EC	A
Motion/speed sensors (speed relative to fixed or moving objects)	Doppler radar	EC	A
	Doppler sound	EC	A
Vision-based sensors (visual ranging, whole-image analy- sis, segmentation, object recognition)	CCD/CMOS camera(s) Visual ranging packages Object tracking packages	EC	P

State	Ch A	Ch B
S <sub>1</sub>	High	Low
S <sub>2</sub>	High	High
S <sub>3</sub>	Low	High
S <sub>4</sub>	Low	Low

Fig 4.2

*Quadrature optical wheel encoder: The observed phase relationship between channel A and B pulse trains are used to determine the direction of the rotation. A single slot in the outer track generates a reference (index) pulse per revolution.*

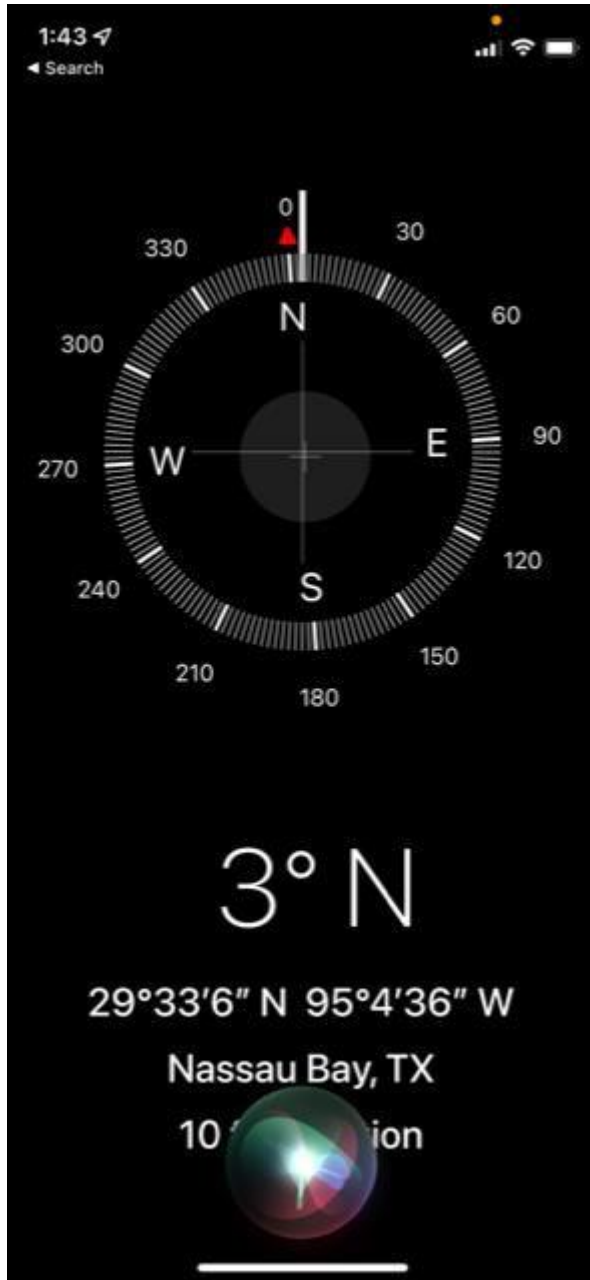

Fig 4.3

*Digital compasses: Sensors such as the Digital/Analog hall effect sensors shown, available from Dinsmore [<http://dinsmoregroup.com/dico>], enable inexpensive (< \$US15) sensing of magnetic fields.*

**Important:** The accuracy of the compass can be affected by magnetic or environmental interference; even the magnets in the iPhone EarPods can cause a deviation. Use the digital compass only for basic navigation assistance. Don't rely on it to determine precise location, proximity, distance, or direction.

## Can Dead Men Vote Twice

CDMVT

C = Compass Heading	291°
D = Deviation	+1
M = Magnetic Heading/Course	290°
V = Variation	5E
T = True Heading/Course	295°

An IMU with six degrees-of-freedom is composed of multiple inertial MEMS sensors that are temperature compensated and calibrated to align on orthogonal axes. An internal **three-axis gyroscope** capability measures rotation about a known point while a three-axis **accelerometer** measures displacement.

# 12 different types of sensors

My Roomba is pretty smart! Humans have 5 senses ?

<b>Pos. system</b>	<b>Short description</b>	<b>Advantage</b>	<b>Drawbacks</b>
<b>Odometry</b>	Position determination by integrating wheel speed information	<ul style="list-style-type: none"> <li>• cheap</li> </ul>	<ul style="list-style-type: none"> <li>• distance drift</li> </ul>
<b>Inertial navigation</b>	Sensing minor accelerations in all directional axes and integrating over time to derive velocity and position	<ul style="list-style-type: none"> <li>• no ground contact needed</li> </ul>	<ul style="list-style-type: none"> <li>• time drift</li> <li>• expensive</li> </ul>
<b>Compass</b>	Measures direction heading based on Earth's magnetic field	<ul style="list-style-type: none"> <li>• cheap</li> <li>• no time drift</li> </ul>	<ul style="list-style-type: none"> <li>• sensitive to magnetic anomalies</li> <li>• limited accuracy</li> </ul>
<b>Gyroscope</b>	Direction heading based on the inertial properties of a rapidly spinning motor or other techniques like optical gyroscope	<ul style="list-style-type: none"> <li>• insensitive to magnetic anomalies</li> </ul>	<ul style="list-style-type: none"> <li>• time drift</li> <li>• expensive</li> </ul>
<b>Ultrasonic distance</b>	Time of flight measurement for an ultrasonic chirp (pulse) to travel to a reflective object	<ul style="list-style-type: none"> <li>• cheap</li> </ul>	<ul style="list-style-type: none"> <li>• no focusing</li> <li>• slow</li> <li>• limited range</li> <li>• artifact by echoes</li> </ul>
<b>Light/Laser triangulation</b>	Reflection angle measurement of an emitted light beam	<ul style="list-style-type: none"> <li>• cheap</li> <li>• fast</li> </ul>	<ul style="list-style-type: none"> <li>• limited range</li> </ul>
<b>Laser time of flight</b>	Time of flight or phase shift measurement of an emitted light pulse	<ul style="list-style-type: none"> <li>• fast</li> </ul>	<ul style="list-style-type: none"> <li>• expensive</li> </ul>
<b>Landmark recognition</b>	Distance and/or angle measurement between the robot and an artificial landmark	<ul style="list-style-type: none"> <li>• absolute position</li> </ul>	<ul style="list-style-type: none"> <li>• external set up</li> </ul>
<b>Stereo vision</b>	Distance measurement by object recognition of two staggered images	<ul style="list-style-type: none"> <li>• no external set up</li> </ul>	<ul style="list-style-type: none"> <li>• complex algorithm</li> <li>• not reliable</li> </ul>
<b>GPS</b>	Global positioning system based on satellites	<ul style="list-style-type: none"> <li>• absolute position</li> </ul>	<ul style="list-style-type: none"> <li>• free sky view</li> </ul>

Table 1-1: Mostly used sensor system for robot positioning

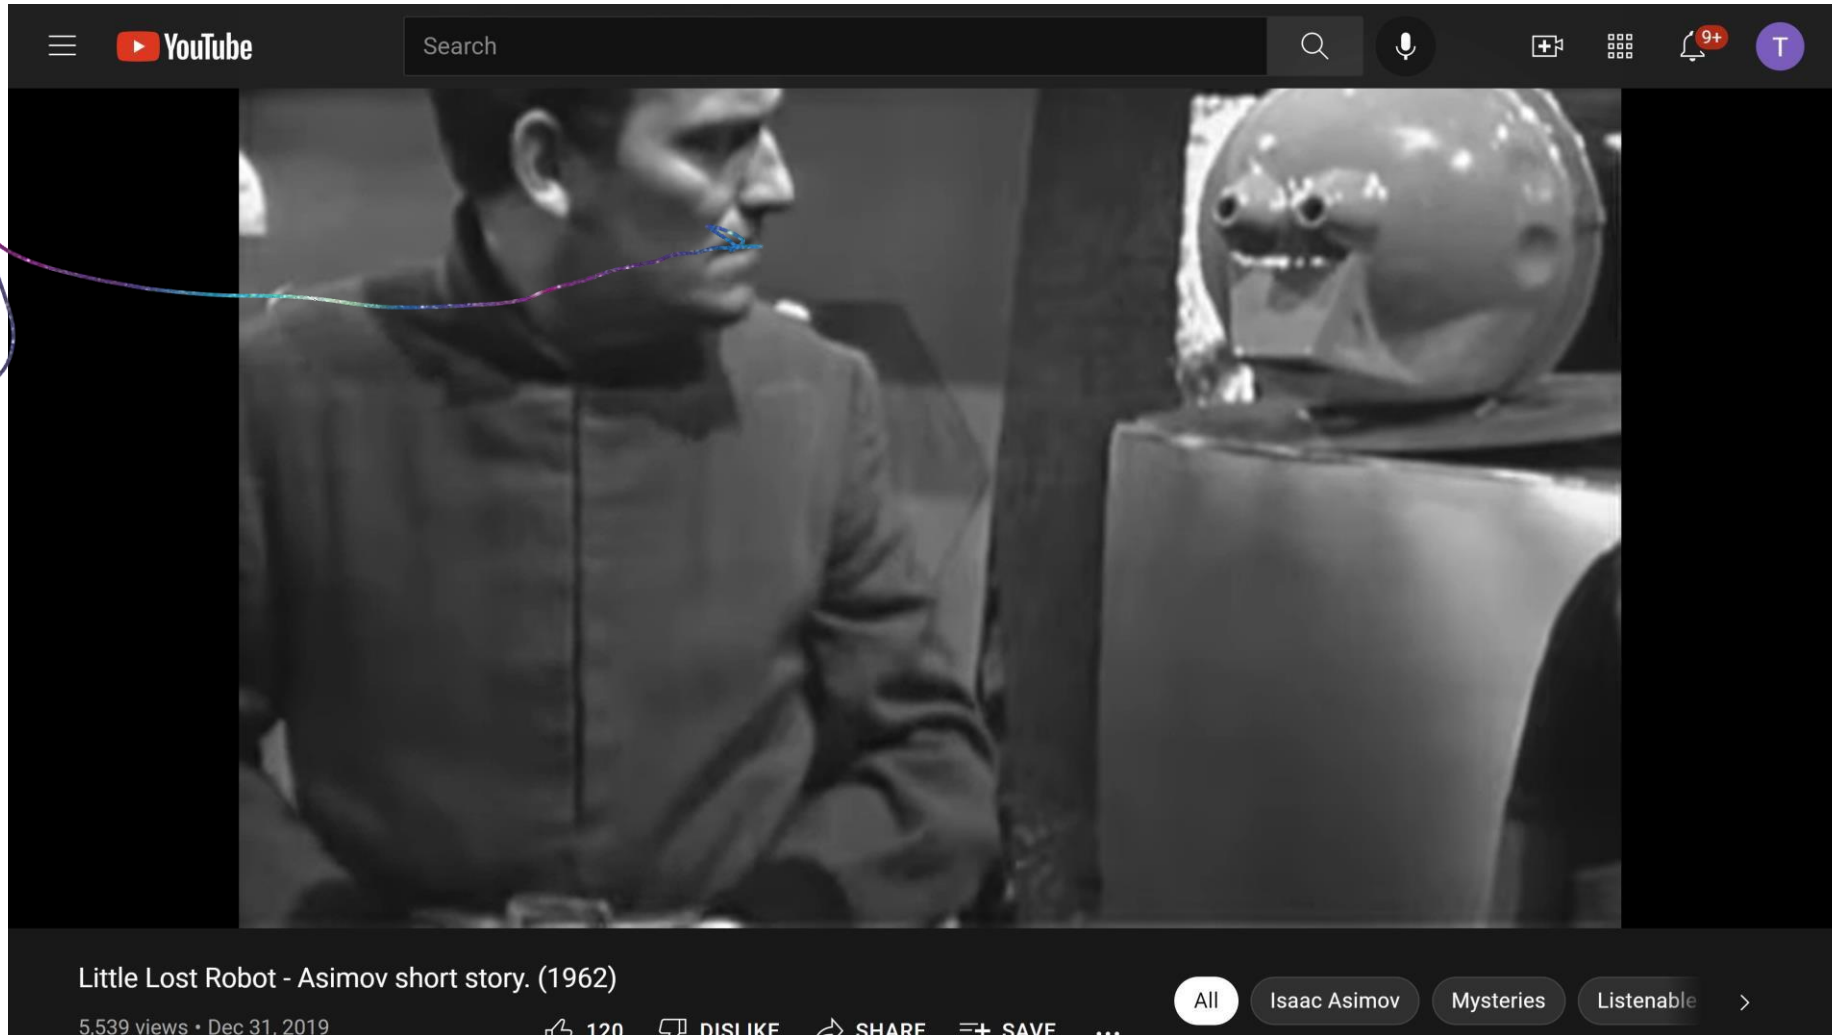

**Jonny 5 - WHERE AM I?**

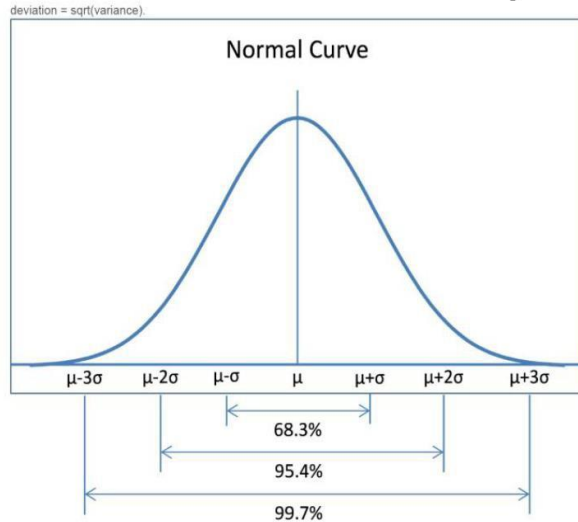

"**Little Lost Robot**" is a [science fiction short story](#) by American writer [Isaac Asimov](#). It was first published in the March 1947 issue of [Astounding Science Fiction](#) and reprinted in the collections [I, Robot](#) (1950), [The Complete Robot](#) (1982), [Robot Dreams](#) (1986), and [Robot Visions](#) (1990).

# Odometry Errors & Variance & Covariance

Consider  $u$  in the graph as your true value. The value in your Twist message has some error associated with it. If you set the s.d. for linear.x as 1 ( $\text{cov}(\text{linear.x}, \text{linear.x}) = 1^2 = 1$ ), it means if you take 100 measurements of linear.x, 68.3% will lie between  $[\text{truevalue}-1, \text{truevalue}+1]$  i.e.  $[u-s.d., u+s.d.]$

*Fig 4.31*      *The Gaussian function with  $\mu = 0$  and  $\sigma = 1$ . We shall refer to this as the Reference Gaussian. The value  $2\sigma$  is often referred for the signal quality. 95.44% of the values are falling within  $\pm 2\sigma$ .*

*Growth of the pose uncertainty for straight line movement: No*
